1. Safety Precautions

Electricity can cause severe injuries even with low voltages or currents.

Therefore it is extremely important that you read the following information before using your high voltage insulation tester.

- a. This Instrument must only be used and operated by a competent trained person and in strict accordance with the instructions. we will not accept liability for any damage or injury caused by misuse or non compliance with instructions and safety procedures.
- b. This instrument must not be used on live circuits. Ensure all circuits are de-energised before testing. see paragraph for details of built-in warning features should your high voltage insulation tester be connected to a live system.
- c. Always inspect your high voltage insulation tester and test leads before use for any sign of abnormality or damage. If any abnormal conditions exist (broken test leads, cracked case, display faulty etc...) do not attempt to take any measurement or use the tester. Return your high voltage insulation tester to your nearest distributor for service.
- d. Your high voltage insulation tester has been designed with your safety in mind. However, no design can completely protect against incorrect use. Electrical circuits can be dangerous and / or lethal when a lack of caution or poor safety practice is used.
- e. Pay attention to cautions and warnings which will inform you of potentially dangerous procedures.
- f. Your high voltage insulation tester has a live circuit warning beeper. If it is connected to a live circuit, a rapid pulsating bleep will be heard. DO NOT proceed to test and immediately disconnect the instrument from the circuit. In addition your tester will display the warning message.

g. Rated environmental conditions :

- (1) Indoor use.
- (2) Installation Category IV.
- (3) Pollution Degree 2.
- (4) Altitude up to 2000 meters.
- (5) Relative humidity 80% max.

(G) Introduction of other functions

1. Dielectric absorption ratio (DAR):

Ratio of insulation resistance between 1-min and 30-sec

$$\text{DAR} : \frac{\text{1-min insulation resistance}}{\text{30-sec insulation resistance}}$$

2. Polarization index (PI):

Ratio of insulation resistance between 10-min and 1-min

$$\text{PI} : \frac{\text{10-min insulation resistance}}{\text{1-min insulation resistance}}$$

Lower insulation resistance tested takes longer test time, which would deteriorate the specimen. Thus, higher DAR or PI (as close to 1) would create better insulation grade of specimen.

⚠ Operation:

During the test run, wait for one minute, DAR will be displayed automatically; wait for 10 minutes, PI will be displayed automatically.

3. AUTO OFF:

System will shutdown automatically after 3 minutes without operation.

8. Battery replacement

When "Low Battery" info shows on the LCD.

Disconnect the test leads from the 10kV high voltage insulation tester, and turn off the power.

Replace with new Alkaline batteries.(1.5V "C" × 8)

9. Maintenance & repair

- (A) To avoid and electric-shock or device damage, do not wet inner part of the tester.
- (B) Avoid the tester from being dropped down that would damage or disconnect devices apart.
- (C) Wipe the tester surface with soft, dry cloth and mild detergent. Prohibit from using sand paper or solvent.

Note:

1. This tester is HV operated; user should not open the outer casing. If any damage occurs, take the tester back to manufacturer for repair.
